## WEST PARK RADIOPS AMATEUR RADIO CLUB

### WEST PARK NEWS \*

\*Subject to change

Monday night nets are on the NODXA's repeater at 8 p.m. Listen or check in. Join the fun. We thank the Northern Ohio DX Association for our use of their repeater, W8DXA, 147.36+ (107.2). Our meeting schedule is changing. Pay attention to our opportunities to announce meeting changes.

### UPCOMING CONTESTS AND ACTIVITIES...

(sourced from WA7BNM and ARRL information)

- |        |                               |                               |

### WEST PARK RADIOPS MEETINGS & PROGRAMS FOR 2024\*

August 13 North Olmsted Library 2:30 p.m.\*

\* Subject to Change,  
Including order of events,  
locations and times.

September 10 Golden Corral 11:30 a.m.\*

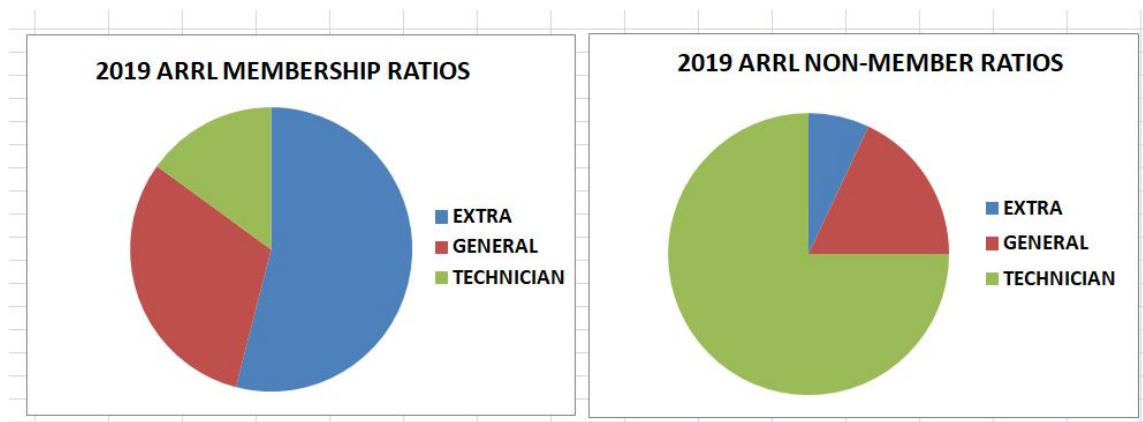

## THE POPULATION OF HAMS IN THE U.S. ...

(abridged)

by WB2ITX, Howard Michel, former CEO of ARRL

In May 2019 QST

Fifty-four percent of our current members have an Amateur Extra-class license, 31% have a General-class license, and 15% have a Technician-class license. But the pool of non-member amateurs is very different. They, too, are generally white males, but younger. In a category we call "rookies," the average age is 52. In terms of license class, 75% are Technicians, while 7% are Amateur Extra, and 18% have a General-class license.

## ARRL SERVER DISRUPTION ...

(from ARRL webpage news )

Aug 7, 2024: ARRL Service Disruption - Affect on Awards / Logbook --

"To all Award participants: UPDATE - Current estimated DXCC System restoration date is by August 20th.

The ARRL Awards System has (3) flow processes: One process is Logbook; one process is Paper Applications by Mail; and the last process bring Logbook and Paper Applications together in a Master DXCC Processing System. At present, while the Logbook program is now allowing customers to submit/complete Award applications online (this began about July 1st), the Master DXCC Processing System remains offline, therefore we are not yet able to fully complete final processing of any DXCC applications at this time. As soon as the Master DXCC Processing System is back on line, we can then finish the final processing of Paper or Logbook applications received.

Worked All States (WAS) applications, endorsement stickers and certificates are able to be processed and certificates are able to be printed and mailed, as they do not flow through the Master DXCC Processing System.

VUCC applications are being processed and completed, certificates and endorsement stickers are being mailed.

Please also note that as the "Online DXCC" application system is not yet operational - it too is tied to the Master DXCC Processing System currently offline."

## HOW TO QSL...

QSLing

Beginners:

[https://en.wikipedia.org/wiki/QSL\\_card](https://en.wikipedia.org/wiki/QSL_card)

For the Eight Area, what you need to know/review:

[https://arri-greatlakes.org/8th\\_bureau.html](https://arri-greatlakes.org/8th_bureau.html)

There is a lot of information there. One detail that I know personally: you can send SASEs to your letter manager using A7 size envelopes. What is an A7 envelope? So next time you get or send a birthday card or Christmas card and it appears to be the "usual size" for those, you are looking at an A7 envelope.

There's a problem, though, with A7 envelopes, is that the paper stock material may not be strong enough to hold a large number of QSL cards (thickness) going through a USPS sorting machine. So SASEs using strong manila colored 6x9 envelopes is a better choice.

By the way, have you ever looked up the USPS rules on addressing envelopes? There is a lot to learn there.

Here's a quotation from the 8th-bureau web page: "If you don't worry about us wasting your postage, put "mail every cycle" on the bottom of each SASE and we will send you what you have each time"

Here's what the USPS says about the location "mail every cycle" of information on the face of an envelope:

Automated mail processing machines read addresses on mailpieces from the bottom up and will first look for a city, state, and ZIP Code. Then the machines look for a delivery address. If the machines can't find either line, then your mailpiece could be delayed or misrouted. Any information below the delivery address line (a logo, a slogan, or an attention line) could confuse the machines and misdirect your mail.

One time I got a piece of junk mail where below the address line of city and state the sender printed FINAL WARNING (or something like that). The junk mail had obviously been sent to France and back before I received it.

So don't follow that rule from the bureau. Maybe put "mail every cycle" on the back of the envelope. You don't need your QSL card envelopes routed through Madagascar.

These days the flow of QSL cards has really slowed down. The Logbook of The World (LoTW) and eQSL have probably caused a big reduction in real QSL card flow. Don't expect cards to come more than once every nine months or so.

## **WSJT-X FT8 NEW SUPERFOX/SUPERHOUND DETAIL...**

### **WORKING SUPERFOX DX ON FT8**

**ADVICE** here. Check where the 750 Hz pilot tone operating frequency reads out in FT8 in the Band Activity window (left side). The SuperFox frequency will be listed. The frequency tolerance for the SuperFox responses to be decoded is 750 HZ +/- 100 Hz. If you see that the SuperFox's frequency readout in the Band Activity window is outside the tolerance range, move your VFO or RIT slightly to get the SuperFox audio frequency into the range of the required frequency.

## **SUPERFOX CODING SUPER SIMPLIFIED ...**

### **SUPERFOX TRANSMISSION OF TEXT**

If you listen to the SuperFox transmissions, it should sound to you like a chorus of short musical chirps in completely random order, like a poorly composed song. That's a detail of the "Q-ary code" used by the new SuperFox coding. Imagine it's like this. The French song "Alouette" could stand for A. "Born in the U.S.A." could stand for B. "Mary Had a Little Lamb" could be used for M. Well, it's only kind of like that. Combine some "tunes" for a series of ONEs and ZEROs that are a compressed data code version of nine streams of data and you have a very rudimentary explanation of how SuperFox modulation works.

## **CATHODE POISONING...**

Wikipedia's hot cathode page discusses how part of a vacuum tube really works.

From a long time ago, before World War II:

"The activated electrodes can be destroyed by contact with oxygen or other chemicals (e.g. aluminum, or silicates), either present as residual gases, entering the tube via leaks, or released by outgassing or migration from the construction elements. This results in diminished emissivity. This process is known as cathode poisoning. High-reliability tubes had to be developed for the early Whirlwind computer, with filaments free of traces of silicon."

"Barium oxide reacts with traces of silicon in the underlying metal, forming barium silicate (Ba<sub>2</sub>SiO<sub>4</sub>) layer. This layer has high electrical resistance, especially under discontinuous current load, and acts as a resistor in series with the cathode. This is particularly undesirable for tubes used in computer Applications, where they can stay without conducting current for extended periods of time.[9]"

Silicates contain the element silicon. So if physicists had studied in more detail the "silicates" on vacuum tube cathodes way early in the 20th century, perhaps they would have learned about the nice features of semiconduction in silicon. Then perhaps we would have had personal computers and smartphones during the Korean War, or even earlier.

## **DXCC AND KH5 ...**

So recently the DXAC has been considering whether to split Palmyra & Jarvis (KH5) into two separate entities because between the two the International Dateline winds around Kiribati. Per DXCC rule 2(b)(iii) there is "an intervening DXCC entity" that specifies that Palmyra and Jarvis should be separated.

Trivia: per Wikipedia, Kiribati's island locations are such that it is the "the only country in the world located simultaneously in all four hemispheres: the Northern, Southern, Western, and Eastern hemispheres."

## **NEW VERSION OF WSJT-X WITH SUPERFOX...**

Available for download here. Be sure to download and install the "2.7.0-rc" version.

<https://wsjt.sourceforge.io/wsjitx.html>

**NOTE:** if you have installed WSJT-X before, you can keep from disturbing your setup and log files as new versions of WSJT-X come, out by installing in a **NEW** folder every time. Each new version of WSJT-X uses the existing data files because each version knows where the existing data files should be.

Be sure to locate the **SHARE** folder of the new installation to find the **NEW** User Guide. **READ THE SECTIONS FOR FT8!!!**

### WSJT-X System Requirements (per the User Guide)

SSB transceiver and antenna

Computer running Windows 7 or later, macOS 10.13 or later, or Linux

1.5 GHz or faster CPU and 200 MB of available memory; faster machines are better

Monitor with at least 1024 x 780 resolution

Computer-to-radio interface using a serial port or equivalent USB device for T/R switching, or CAT control, or VOX, as required for your radio-to-computer connections

Audio input and output devices supported by the operating system and configured for sample rate 48000 Hz, 16 bits

Audio or equivalent USB connections between transceiver and computer

A means for synchronizing the computer clock to UTC within  $\pm 1$  second

----- - de AF8C

I will add one opinion: computer should use a Solid State Drive.
